torch.outer#

https://pytorch.org/docs/stable/generated/torch.outer.html#torch.outer

Description:

Outer product of input and vec2. If input is a vector of size nnn and vec2 is a vector of size mmm, then out must be a matrix of size (n×m)(n \times m)(n×m). This function does not broadcast. input (Tensor) – 1-D input vector vec2 (Tensor) – 1-D input vector

Function Signature

```
torch.outer(input, vec2, *, out=None) → Tensor#
Parameters
Keyword Arguments
```

Parameters

Keyword

out (Tensor, optional) – optional output matrix

Code Examples

```
>>> v1 = torch.arange(1., 5.)
>>> v2 = torch.arange(1., 4.)
>>> torch.outer(v1, v2)
tensor([[  1.,   2.,   3.],
        [  2.,   4.,   6.],
        [  3.,   6.,   9.],
        [  4.,   8.,  12.]])
```

Notes & Warnings

NOTE Note This function does not broadcast.

Detailed Documentation

Documentation

Outer product of input and vec2. If input is a vector of size nnn and vec2 is a vector of size mmm, then out must be a matrix of size (n×m)(n \times m)(n×m).

This function does not broadcast.

input (Tensor) – 1-D input vector

vec2 (Tensor) – 1-D input vector

out (Tensor, optional) – optional output matrix
