> *Returns x + y element-wise.*

Function Signatures

```
tf.compat.v1.math.add( x, y, name=None )
tf.add(x, y)
```

Code Examples

```
tf.compat.v1.math.add(
x, y, name=None
)
```

```
tf.compat.v1.math.add(
x, y, name=None
)
```

```
x = [1, 2, 3, 4, 5]
y = 1
tf.add(x, y)
```

```
x = [1, 2, 3, 4, 5]
```

```
tf.add(x, y)
```

```
dtype=int32)>
```

Documentation

Returns x + y element-wise.

Example usages below.

Add a scalar and a list:

Note that binary + operator can be used instead:

Add a tensor and a list of same shape:

For example,

When adding two input values of different shapes, Add follows NumPy broadcasting rules. The two input array shapes are compared element-wise. Starting with the trailing dimensions, the two dimensions either have to be equal or one of them needs to be 1.

For example,

Another example with two arrays of different dimension.

The reduction version of this elementwise operation is tf.math.reduce_sum
