torch.angle#

https://pytorch.org/docs/stable/generated/torch.angle.html

Description:

Computes the element-wise angle (in radians) of the given input tensor. input (Tensor) – the input tensor. out (Tensor, optional) – the output tensor. Starting in PyTorch 1.8, angle returns pi for negative real numbers, zero for non-negative real numbers, and propagates NaNs. Previously the function would return zero for all real numbers and not propagate floating-point NaNs.

Function Signature

```
torch.angle(input: Tensor, *, out: Optional[Tensor]) → Tensor#

Parameters

Keyword Arguments
```

Parameters

Keyword

out (Tensor, optional) – the output tensor.

Code Examples

```
>>> torch.angle(torch.tensor([-1 + 1j, -2 + 2j, 3 -
3j]))*180/3.14159
tensor([ 135.,  135,  -45])
```

Notes & Warnings

NOTE

Note Starting in PyTorch 1.8, angle returns pi for negative real numbers, zero for non-negative real numbers, and propagates NaNs. Previously the function would return zero for all real numbers and not propagate floating-point NaNs.

Detailed Documentation

Documentation

Computes the element-wise angle (in radians) of the given input tensor.

input (Tensor) – the input tensor.

out (Tensor, optional) – the output tensor.

Starting in PyTorch 1.8, angle returns pi for negative real numbers, zero for non-negative real numbers, and propagates NaNs. Previously the function would return zero for all real numbers and not propagate floating-point NaNs.

Computes the element-wise angle (in radians) of the given input tensor.

input (Tensor) – the input tensor.

out (Tensor, optional) – the output tensor.

Starting in PyTorch 1.8, angle returns pi for negative real numbers, zero for non-negative real numbers, and propagates NaNs. Previously the function would return zero for all real numbers and not propagate floating-point NaNs.
