tf.size Stay organized with collections Save and categorize content based on your preferences.

https://www.tensorflow.org/api_docs/python/tf/size

> *Returns the size of a tensor.*

Function Signatures

```
tf.size( input, out_type=None, name=None )
```

Code Examples

```
tf.size(
input, out_type=None, name=None
)
```

```
tf.size(
input, out_type=None, name=None
)
```

```
t = tf.constant([[[1, 1, 1], [2, 2, 2]], [[3, 3, 3], [4, 4, 4]]])
tf.size(t)
```

```
t = tf.constant([[[1, 1, 1], [2, 2, 2]], [[3, 3, 3], [4, 4, 4]]])
```

```
```

Documentation

Returns the size of a tensor.

Used in the notebooks

• Matrix approximation with Core APIs

- Introduction to Tensors
- BERT Preprocessing with TF Text
- Scalable model compression
- Client-efficient large-model federated learning via `federated_select` and sparse aggregation
- Sending Different Data To Particular Clients With tff.federated_select
- Human Pose Classification with MoveNet and TensorFlow Lite
- Federated Learning for Image Classification

See also tf.shape.

Returns a 0-D Tensor representing the number of elements in input
of type out_type. Defaults to tf.int32.

For example:

Returns

numpy compatibility

Equivalent to np.size()
