torch.chunk#

https://pytorch.org/docs/stable/generated/torch.chunk.html#torch.chunk

Description:

Attempts to split a tensor into the specified number of chunks. Each chunk is a view of the input tensor. This function may return fewer than the specified number of chunks! torch.tensor_split() a function that always returns exactly the specified number of chunks

Function Signature

```
torch.chunk(input: Tensor, chunks: int, dim: int = 0) →
Tuple[Tensor, ...]#

Parameters
```

Code Examples

```
>>> torch.arange(11).chunk(6)
(tensor([0, 1]),
 tensor([2, 3]),
 tensor([4, 5]),
 tensor([6, 7]),
 tensor([8, 9]),
 tensor([10]))
>>> torch.arange(12).chunk(6)
(tensor([0, 1]),
 tensor([2, 3]),
 tensor([4, 5]),
 tensor([6, 7]),
 tensor([8, 9]),
 tensor([10, 11]))
>>> torch.arange(13).chunk(6)
(tensor([0, 1, 2]),
 tensor([3, 4, 5]),
 tensor([6, 7, 8]),
 tensor([ 9, 10, 11]),
 tensor([12]))
```

Notes & Warnings

NOTE

Note This function may return fewer than the specified number of chunks!

NOTE

See also torch.tensor_split() a function that always returns exactly the specified number of chunks

Detailed Documentation

Documentation

Attempts to split a tensor into the specified number of chunks. Each chunk is a view of the input tensor.

This function may return fewer than the specified number of chunks!

torch.tensor_split() a function that always returns exactly the specified number of chunks

If the tensor size along the given dimension dim is divisible by chunks, all returned chunks will be the same size. If the tensor size along the given dimension dim is not divisible by chunks, all returned chunks will be the same size, except the last one. If such division is not possible, this function may return fewer than the specified number of chunks.

input (Tensor) – the tensor to split

chunks (int) – number of chunks to return

dim (int) – dimension along which to split the tensor
