torch.conj#

https://pytorch.org/docs/stable/generated/torch.conj.html

Description:

Returns a view of input with a flipped conjugate bit. If input has a non-complex dtype, this function just returns input. torch.conj() performs a lazy conjugation, but the actual conjugated tensor can be materialized at any time using torch.resolve_conj(). In the future, torch.conj() may return a non-writeable view for an input of non-complex dtype. It's recommended that programs not modify the tensor returned by torch.conj_physical() when input is of non-complex dtype to be compatible with this change.

Function Signature

```
torch.conj(input) → Tensor#

Parameters
```

Code Examples

```
>>> x = torch.tensor([-1 + 1j, -2 + 2j, 3 - 3j])
>>> x.is_conj()
False
>>> y = torch.conj(x)
>>> y.is_conj()
True
```

Notes & Warnings

NOTE Note torch.conj() performs a lazy conjugation, but the actual conjugated tensor can be materialized at any time using torch.resolve_conj().

⚠ **WARNING** Warning In the future, torch.conj() may return a non-writeable view for an input of non-complex dtype. It’s recommended that programs not modify the tensor returned by torch.conj_physical() when input is of non-complex dtype to be compatible with this change.

Detailed Documentation

Documentation

Returns a view of input with a flipped conjugate bit. If input has a non-complex dtype, this function just returns input.

torch.conj() performs a lazy conjugation, but the actual conjugated tensor can be materialized at any time using torch.resolve_conj().

In the future, torch.conj() may return a non-writeable view for an input of non-complex dtype. It's recommended that programs not modify the tensor returned by torch.conj_physical() when input is of non-complex dtype to be compatible with this change.

input (Tensor) – the input tensor.
