> *Calculate the mean and variance of x.*

Function Signatures

```
tf.compat.v1.nn.moments( x, axes, shift=None, name=None, keep_dims=None, keepdims=None )
```

Code Examples

```
tf.compat.v1.nn.moments(
x, axes, shift=None, name=None, keep_dims=None, keepdims=None
)
```

```
tf.compat.v1.nn.moments(
x, axes, shift=None, name=None, keep_dims=None, keepdims=None
)
```

Documentation

Calculate the mean and variance of x.

The mean and variance are calculated by aggregating the contents of x across axes. If x is 1-D and axes = [0] this is just the mean and variance of a vector.

When using these moments for batch normalization (see tf.nn.batch_normalization):

- for so-called "global normalization", used with convolutional filters with

shape [batch, height, width, depth], pass axes=[0, 1, 2].

- for simple batch normalization pass axes=[0] (batch only).
