DimDynamic#

https://pytorch.org/docs/stable/generated/torch.fx.experimental.symbolic_sha

Description:

Controls how to perform symbol allocation for a dimension. It is always sound to default this to DYNAMIC, but the policies DUCK and STATIC can result in better trace-time and compile-time performance, as they reduce the number of allocated symbols and generally make your graph more static. NB: If we notice you've applied a constraint to the dimension, we will force it to DYNAMIC for simplicity. DimDynamic is controlled by a variety of higher level UX features. Currently: The default is changed to STATIC with assume_static_by_default. An individual dim is marked DYNAMIC if you mark_dynamic_dim.

Function Signature

```
class
torch.fx.experimental.symbolic_shapes.DimDynamic(value)
[source]#

In eager mode, the default policy is DUCK.

In export mode, the default policy is STATIC.
```

Detailed Documentation

Documentation

Controls how to perform symbol allocation for a dimension. It is always sound to default this to DYNAMIC, but the policies DUCK and STATIC can result in better trace-time and compile-time performance, as they reduce the number of allocated symbols and generally make your graph more static.

NB: If we notice you've applied a constraint to the dimension, we will force it to DYNAMIC for simplicity.

DimDynamic is controlled by a variety of higher level UX features. Currently:

The default is changed to STATIC with assume_static_by_default.

An individual dim is marked DYNAMIC if you mark_dynamic_dim.

An individual dim is marked DYNAMIC if you specify it in dynamic_shapes passed to export.
