> *Returns a dense Tensor as input layer based on given feature_columns. (deprecated)*

Function Signatures

```
tf.compat.v1.feature_column.input_layer( features,
feature_columns, weight_collections=None, trainable=True,
cols_to_vars=None, cols_to_output_tensors=None )
```

Code Examples

```
tf.compat.v1.feature_column.input_layer(
features,
feature_columns,
weight_collections=None,
trainable=True,
cols_to_vars=None,
cols_to_output_tensors=None
)
```

```
tf.compat.v1.feature_column.input_layer(
features,
feature_columns,
weight_collections=None,
trainable=True,
cols_to_vars=None,
cols_to_output_tensors=None
)
```

```
price = numeric_column('price')
keywords_embedded = embedding_column(
categorical_column_with_hash_bucket("keywords", 10K),
dimensions=16)
columns = [price, keywords_embedded, ...]
features = tf.io.parse_example(...,
features=make_parse_example_spec(columns))
dense_tensor = input_layer(features, columns)
for units in [128, 64, 32]:
dense_tensor = tf.compat.v1.layers.dense(dense_tensor, units,
tf.nn.relu)
prediction = tf.compat.v1.layers.dense(dense_tensor, 1)
```

```
price = numeric_column('price')
keywords_embedded = embedding_column(
categorical_column_with_hash_bucket("keywords", 10K),
dimensions=16)
columns = [price, keywords_embedded, ...]
features = tf.io.parse_example(...,
features=make_parse_example_spec(columns))
dense_tensor = input_layer(features, columns)
for units in [128, 64, 32]:
dense_tensor = tf.compat.v1.layers.dense(dense_tensor, units,
tf.nn.relu)
prediction = tf.compat.v1.layers.dense(dense_tensor, 1)
```

Documentation

Returns a dense Tensor as input layer based on given feature_columns. (deprecated)

Generally a single example in training data is described with FeatureColumns.
At the first layer of the model, this column oriented data should be converted
to a single Tensor.

Example:

Returns

Raises
