MemPool#

https://pytorch.org/docs/stable/generated/torch.cuda.memory.MemPool.html#tor

Description:

MemPool represents a pool of memory in a caching allocator. Currently, it's just the ID of the pool object maintained in the CUDACachingAllocator. allocator (torch._C._cuda_CUDAAllocator, optional) – a torch._C._cuda_CUDAAllocator object that can be used to define how memory gets allocated in the pool. If allocator is None (default), memory allocation follows the default/ current configuration of the CUDACachingAllocator. use_on_oom (bool) – a bool that indicates if this pool can be used as a last resort if a memory allocation outside of the pool fails due to Out Of Memory. This is False by default. Returns the allocator this MemPool routes allocations to. Returns the ID of this pool as a tuple of two ints.

Function Signature

```
class torch.cuda.memory.MemPool(*args, **kwargs)[source]#

Parameters

property allocator: Optional[_cuda_CUDAAllocator]#

property id: tuple[int, int]#

snapshot()[source]#
```

Returns:

int

Notes & Warnings

NOTE Note See Memory management for more details about GPU memory management.

Detailed Documentation

Documentation

MemPool represents a pool of memory in a caching allocator. Currently, it’s just the ID of the pool object maintained in the CUDACachingAllocator.

allocator (torch._C._cuda_CUDAAllocator, optional) – a torch._C._cuda_CUDAAllocator object that can be used to define how memory gets allocated in the pool. If allocator is None (default), memory allocation follows the default/ current configuration of the CUDACachingAllocator.

use_on_oom (bool) – a bool that indicates if this pool can be used as a last resort if a memory allocation outside of the pool fails due to Out Of Memory. This is False by default.

Returns the allocator this MemPool routes allocations to.

Returns the ID of this pool as a tuple of two ints.

Return a snapshot of the CUDA memory allocator pool state across all devices.

Interpreting the output of this function requires familiarity with the memory allocator internals.

See Memory management for more details about GPU memory management.

Returns the reference count of this pool.
