> *Computes the element-wise (weighted) mean of the given tensors.*

Function Signatures

```
tf.compat.v1.metrics.mean_tensor( values, weights=None,
metrics_collections=None, updates_collections=None, name=None
)
```

Code Examples

```
tf.compat.v1.metrics.mean_tensor(
values,
weights=None,
metrics_collections=None,
updates_collections=None,
name=None
)
```

```
tf.compat.v1.metrics.mean_tensor(
values,
weights=None,
metrics_collections=None,
updates_collections=None,
name=None
)
```

Documentation

Computes the element-wise (weighted) mean of the given tensors.

In contrast to the mean function which returns a scalar with the mean, this function returns an average tensor with the same shape as the input tensors.

The mean_tensor function creates two local variables, total_tensor and count_tensor that are used to compute the average of values. This average is ultimately returned as mean which is an idempotent operation that simply divides total by count.

For estimation of the metric over a stream of data, the function creates an update_op operation that updates these variables and returns the mean. update_op increments total with the reduced sum of the product of values and weights, and it increments count with the reduced sum of weights.

If weights is None, weights default to 1. Use weights of 0 to mask values.
