Clips tensor values to a maximum average L2-norm. (deprecated)

Function Signatures

```
tf.compat.v1.clip_by_average_norm( t, clip_norm, name=None )
```

Code Examples

```
tf.compat.v1.clip_by_average_norm(  
t, clip_norm, name=None  
)
```

```
tf.compat.v1.clip_by_average_norm(  
t, clip_norm, name=None  
)
```

Documentation

Clips tensor values to a maximum average L2-norm. (deprecated)

Given a tensor `t`, and a maximum clip value `clip_norm`, this operation normalizes `t` so that its average L2-norm is less than or equal to `clip_norm`. Specifically, if the average L2-norm is already less than or equal to `clip_norm`, then `t` is not modified. If the average L2-norm is greater than `clip_norm`, then this operation returns a tensor of the same type and shape as `t` with its values set to:

$$t * clip_norm / l2norm_avg(t)$$

In this case, the average L2-norm of the output tensor is `clip_norm`.

This operation is typically used to clip gradients before applying them with an optimizer.
