*Divides x / y elementwise (using Python 2 division operator semantics).
(deprecated)*

Function Signatures

```
tf.compat.v1.div( x, y, name=None )
```

Code Examples

```
tf.compat.v1.div(  
x, y, name=None  
)
```

```
tf.compat.v1.div(  
x, y, name=None  
)
```

Documentation

Divides x / y elementwise (using Python 2 division operator semantics).
(deprecated)

Migrate to TF2

This function is deprecated in TF2. Prefer using the Tensor division operator, `tf.divide`, or `tf.math.divide`, which obey the Python 3 division operator semantics.

Description

This function divides x and y , forcing Python 2 semantics. That is, if x and y are both integers then the result will be an integer. This is in contrast to Python 3, where division with `/` is always a float while division with `//` is always an integer.
