```

# Documentation

---

Use control flow v2.

control flow v2 (cfv2) is an improved version of control flow in TensorFlow with support for higher order derivatives. Enabling cfv2 will change the graph/function representation of control flow, e.g., `tf.while_loop` and `tf.cond` will generate functional `While` and `If` ops instead of low-level `Switch`, `Merge` etc. ops. Note: Importing and running graphs exported with old control flow will still be supported.

Calling `tf.enable_control_flow_v2()` lets you opt-in to this TensorFlow 2.0 feature.
