https://www.tensorflow.org/api_docs/python/tf/compat/v1/enable_resource_variables

Creates resource variables by default.

Function Signatures

```
tf.compat.v1.enable_resource_variables() -> None
```

Code Examples

```
tf.compat.v1.enable_resource_variables() -> None
```

```
tf.compat.v1.enable_resource_variables() -> None
```

Documentation

Creates resource variables by default.

Resource variables are improved versions of TensorFlow variables with a well-defined memory model. Accessing a resource variable reads its value, and all ops which access a specific read value of the variable are guaranteed to see the same value for that tensor. Writes which happen after a read (by having a control or data dependency on the read) are guaranteed not to affect the value of the read tensor, and similarly writes which happen before a read are guaranteed to affect the value. No guarantees are made about unordered read/write pairs.

Calling `tf.enable_resource_variables()` lets you opt-in to this TensorFlow 2.0 feature.
