https://www.tensorflow.org/api_docs/python/tf/compat/v1/flags/DEFINE_flag

Registers a :class:Flag object with a :class:FlagValues object.

Function Signatures

```
tf.compat.v1.flags.DEFINE_flag( flag,  
flag_values=_flagvalues.FLAGS, module_name=None,  
required=False )
```

Code Examples

```
tf.compat.v1.flags.DEFINE_flag(  
flag, flag_values=_flagvalues.FLAGS, module_name=None,  
required=False  
)
```

```
tf.compat.v1.flags.DEFINE_flag(  
flag, flag_values=_flagvalues.FLAGS, module_name=None,  
required=False  
)
```

Documentation

Registers a `:class:Flag` object with a `:class:FlagValues` object.

By default, the global `:const:FLAGS` `FlagValue` object is used.

Typical users will use one of the more specialized `DEFINE_xxx` functions, such as `:func:DEFINE_string` or `:func:DEFINE_integer`. But developers who need to create `:class:Flag` objects themselves should use this function to register their flags.
