https://www.tensorflow.org/api_docs/python/tf/compat/v1/flags/mark_flags_as_mutual_exclusive

Ensures that only one flag among flag_names is not None.

Function Signatures

```
tf.compat.v1.flags.mark_flags_as_mutual_exclusive(  
    flag_names, required=False, flag_values=_flagvalues.FLAGS )
```

Code Examples

```
tf.compat.v1.flags.mark_flags_as_mutual_exclusive(  
    flag_names, required=False, flag_values=_flagvalues.FLAGS  
)
```

```
tf.compat.v1.flags.mark_flags_as_mutual_exclusive(  
    flag_names, required=False, flag_values=_flagvalues.FLAGS  
)
```

Documentation

Ensures that only one flag among `flag_names` is not `None`.

Important note: This validator checks if flag values are `None`, and it does not distinguish between default and explicit values. Therefore, this validator does not make sense when applied to flags with default values other than `None`, including other false values (e.g. `False`, `0`, `"`, `[]`). That includes multi flags with a default value of `[]` instead of `None`.
