https://www.tensorflow.org/api_docs/python/tf/compat/v1/flags/register_multi_flags_validator

Adds a constraint to multiple flags.

Function Signatures

```
tf.compat.v1.flags.register_multi_flags_validator(  
    flag_names, multi_flags_checker, message='Flags validation  
    failed', flag_values=_flagvalues.FLAGS )
```

Code Examples

```
tf.compat.v1.flags.register_multi_flags_validator(  
    flag_names,  
    multi_flags_checker,  
    message='Flags validation failed',  
    flag_values=_flagvalues.FLAGS  
)
```

```
tf.compat.v1.flags.register_multi_flags_validator(  
    flag_names,  
    multi_flags_checker,  
    message='Flags validation failed',  
    flag_values=_flagvalues.FLAGS  
)
```

Documentation

Adds a constraint to multiple flags.

The constraint is validated when flags are initially parsed, and after each change of the corresponding flag's value.

- input - dict, with keys() being flag_names, and value for each key

being the value of the corresponding flag (string, boolean, etc).

- output - bool, True if validator constraint is satisfied.

If constraint is not satisfied, it should either return False or raise flags.ValidationError.

input - dict, with keys() being flag_names, and value for each key being the value of the corresponding flag (string, boolean, etc).

output - bool, True if validator constraint is satisfied.

If constraint is not satisfied, it should either return False or raise flags.ValidationError.
