`tf.compat.v1.random.get_seed`

Given operation-specific seed, `op_seed`, this helper function returns two seeds derived from graph-level and op-level seeds. Many random operations internally use the two seeds to allow user to change the seed globally for a graph, or for only specific operations.

For details on how the graph-level seed interacts with op seeds, see `tf.compat.v1.random.set_random_seed`.
