https://www.tensorflow.org/api_docs/python/tf/compat/v1/lite/toco_convert

Convert a TensorFlow GraphDef to TFLite. (deprecated)

Function Signatures

```
tf.compat.v1.lite.toco_convert( input_data, input_tensors,  
output_tensors, *args, **kwargs )
```

Code Examples

```
tf.compat.v1.lite.toco_convert(  
input_data, input_tensors, output_tensors, *args, **kwargs  
)
```

```
tf.compat.v1.lite.toco_convert(  
input_data, input_tensors, output_tensors, *args, **kwargs  
)
```

Documentation

Convert a TensorFlow GraphDef to TFLite. (deprecated)

This function is deprecated. Please use `tf.lite.TFLiteConverter` API instead. Conversion can be customized by providing arguments that are forwarded to `build_model_flags` and `build_conversion_flags` (see documentation for details).

Args:

`input_data`: Input data (i.e. often `sess.graph_def`).

`input_tensors`: List of input tensors. Type and shape are computed using `foo.shape` and `foo.dtype`.

`output_tensors`: List of output tensors (only `.name` is used from this).

`*args`: See `build_model_flags` and `build_conversion_flags`.

`**kwargs`: See `build_model_flags` and `build_conversion_flags`.
