https://www.tensorflow.org/api_docs/python/tf/compat/v1/losses/sparse_softmax_cross_entropy

Cross-entropy loss using `tf.nn.sparse_softmax_cross_entropy_with_logits`.

Function Signatures

```
tf.compat.v1.losses.sparse_softmax_cross_entropy( labels,  
logits, weights=1.0, scope=None,  
loss_collection=ops.GraphKeys.LOSSES,  
reduction=Reduction.SUM_BY_NONZERO_WEIGHTS )
```

Code Examples

```
tf.compat.v1.losses.sparse_softmax_cross_entropy(  
    labels,  
    logits,  
    weights=1.0,  
    scope=None,  
    loss_collection=ops.GraphKeys.LOSSES,  
    reduction=Reduction.SUM_BY_NONZERO_WEIGHTS  
)
```

```
tf.compat.v1.losses.sparse_softmax_cross_entropy(  
    labels,  
    logits,  
    weights=1.0,  
    scope=None,  
    loss_collection=ops.GraphKeys.LOSSES,  
    reduction=Reduction.SUM_BY_NONZERO_WEIGHTS  
)
```

Documentation

Cross-entropy loss using `tf.nn.sparse_softmax_cross_entropy_with_logits`.

Used in the notebooks

- Migrate early stopping

`weights` acts as a coefficient for the loss. If a scalar is provided, then the loss is simply scaled by the given value. If `weights` is a tensor of shape `[batch_size]`, then the loss weights apply to each corresponding sample.

Returns

Raises

eager compatibility

The `loss_collection` argument is ignored when executing eagerly. Consider holding on to the return value or collecting losses via a `tf.keras.Model`.
