https://www.tensorflow.org/api_docs/python/tf/compat/v1/math/multiply

*Returns an element-wise $x * y$.*

Function Signatures

```
tf.compat.v1.math.multiply( x, y, name=None )  
x = tf.constant([1, 2, 3, 4])  
tf.math.multiply(x, x)
```

Code Examples

```
tf.compat.v1.math.multiply(  
x, y, name=None  
)
```

```
tf.compat.v1.math.multiply(  
x, y, name=None  
)
```

```
x = tf.constant([[1, 2, 3, 4]])  
tf.math.multiply(x, x)
```

```
x = tf.constant([[1, 2, 3, 4]])
```

```
tf.math.multiply(x, x)
```

```
tf.math.multiply(7,6)
```

```
tf.math.multiply(7,6)
```

Documentation

Returns an element-wise $x * y$.

For example:

Since `tf.math.multiply` will convert its arguments to Tensors, you can also pass in non-Tensor arguments:

If `x.shape` is not the same as `y.shape`, they will be broadcast to a compatible shape. (More about broadcasting [here](#).)

For example:

The reduction version of this elementwise operation is `tf.math.reduce_prod`

Returns

A Tensor. Has the same type as `x`.

Raises

- `InvalidArgumentError`: When `x` and `y` have incompatible shapes or types.
