https://www.tensorflow.org/api_docs/python/tf/compat/v1/math/softmax

Computes softmax activations.

Function Signatures

```
tf.compat.v1.math.softmax( logits, axis=None, name=None,
dim=None )
softmax = tf.exp(logits) / tf.reduce_sum(tf.exp(logits),
axis, keepdims=True)
softmax = tf.nn.softmax([-1, 0., 1.])
```

Code Examples

```
tf.compat.v1.math.softmax(
logits, axis=None, name=None, dim=None
)
```

```
tf.compat.v1.math.softmax(
logits, axis=None, name=None, dim=None
)
```

```
softmax = tf.exp(logits) / tf.reduce_sum(tf.exp(logits), axis,  
keepdims=True)
```

```
softmax = tf.exp(logits) / tf.reduce_sum(tf.exp(logits), axis,  
keepdims=True)
```

```
softmax = tf.nn.softmax([-1, 0., 1.])  
softmax  
  
sum(softmax)
```

```
softmax = tf.nn.softmax([-1, 0., 1.])
```

Documentation

Computes softmax activations.

`tf.compat.v1.nn.softmax`

Used in the notebooks

- Fitting Dirichlet Process Mixture Model Using Preconditioned Stochastic Gradient Langevin Dynamics
 - Classify Flowers with Transfer Learning

Used for multi-class predictions. The sum of all outputs generated by softmax is 1.

This function performs the equivalent of

Example usage:

Returns

Raises
