

tf.compat.v1.string_to_hash_bucket Stay organized with collections Save and categorize content based on your preferences.

https://www.tensorflow.org/api_docs/python/tf/compat/v1/string_to_hash_bucket

Converts each string in the input Tensor to its hash mod by a number of buckets.

Function Signatures

```
tf.compat.v1.string_to_hash_bucket( string_tensor=None,
num_buckets=None, name=None, input=None )
tf.string_to_hash_bucket_fast()
tf.string_to_hash_bucket_strong()
```

Code Examples

```
tf.compat.v1.string_to_hash_bucket(
string_tensor=None, num_buckets=None, name=None, input=None
)
```

```
tf.compat.v1.string_to_hash_bucket(
string_tensor=None, num_buckets=None, name=None, input=None
)
```

Documentation

Converts each string in the input Tensor to its hash mod by a number of buckets.

more details.

`tf.compat.v1.strings.to_hash_bucket`

The hash function is deterministic on the content of the string within the process.

Note that the hash function may change from time to time.

This functionality will be deprecated and it's recommended to use `tf.string_to_hash_bucket_fast()` or `tf.string_to_hash_bucket_strong()`.
