https://www.tensorflow.org/api_docs/python/tf/hessians

Constructs the Hessian of sum of ys with respect to x in xs.

Function Signatures

```
tf.hessians( ys, xs, gate_gradients=False,
             aggregation_method=None, name='hessians' )
hessians()
```

Code Examples

```
tf.hessians(  
  ys,  
  xs,  
  gate_gradients=False,  
  aggregation_method=None,  
  name='hessians'  
)
```

```
tf.hessians(  
  ys,  
  xs,  
  gate_gradients=False,  
  aggregation_method=None,  
  name='hessians'  
)
```

Documentation

Constructs the Hessian of sum of y s with respect to x in x s.

Used in the notebooks

- Generalized Linear Models

`hessians()` adds ops to the graph to output the Hessian matrix of y s with respect to x s. It returns a list of Tensor of length `len(xs)` where each tensor is the Hessian of `sum(ys)`.

The Hessian is a matrix of second-order partial derivatives of a scalar tensor (see https://en.wikipedia.org/wiki/Hessian_matrix for more details).

Returns

`## Raises`
