https://www.tensorflow.org/api_docs/python/tf/no_gradient

Specifies that ops of type op_type is not differentiable.

Function Signatures

```
tf.no_gradient( op_type: str ) -> None
```

Code Examples

```
tf.no_gradient(  
    op_type: str  
) -> None
```

```
tf.no_gradient(  
    op_type: str  
) -> None
```

```
tf.no_gradient("Size")
```

```
tf.no_gradient("Size")
```

Documentation

Specifies that ops of type `op_type` is not differentiable.

more details.

`tf.compat.v1.NoGradient`,
`tf.compat.v1.no_gradient`

`tf.compat.v1.NotDifferentiable`,

This function should not be used for operations that have a well-defined gradient that is not yet implemented.

This function is only used when defining a new op type. It may be used for ops such as `tf.size()` that are not differentiable. For example:

The gradient computed for '`op_type`' will then propagate zeros.

For ops that have a well-defined gradient but are not yet implemented, no declaration should be made, and an error must be thrown if an attempt to request its gradient is made.
