Python File Write

[< Previous](#)[Next >](#)

Write to an Existing File

To write to an existing file, you must add a parameter to the `open()` function:

`"a"` - Append - will append to the end of the file

`"w"` - Write - will overwrite any existing content

Example

[Get your own Python Server](#)

Open the file "demofile.txt" and append content to the file:

```
with open("demofile.txt", "a") as f:
    f.write("Now the file has more content!")
```

Overwrite Existing Content

To overwrite the existing content to the file, use the `w` parameter:

Example

Open the file "demofile.txt" and overwrite the content:

Python Matplotlib

[Matplotlib Intro](#)[Matplotlib Get Started](#)[Matplotlib Pyplot](#)[Matplotlib Plotting](#)[Matplotlib Markers](#)[Matplotlib Line](#)[Matplotlib Labels](#)

```
with open("demofile.txt", "w") as f:
    f.write("Woops! I have deleted the content!")

#open and read the file after the overwriting:
with open("demofile.txt") as f:
    print(f.read())
```

[Run Example »](#)

Note: the "w" method will overwrite the entire file.

Create a New File

To create a new file in Python, use the `open()` method, with one of the following parameters:

"x" - Create - will create a file, returns an error if the file exists

"a" - Append - will create a file if the specified file does not exists

"w" - Write - will create a file if the specified file does not exists

Example

Create a new file called "myfile.txt":

```
f = open("myfile.txt", "x")
```

[Run Example »](#)

Result: a new empty file is created.

Note: If the file already exist, an error will be raised.

Exercise ?

What happens to the original file content if you open a file
