Python Numbers

There are three numeric types in Python:

- `int`
- `float`
- `complex`

Variables of numeric types are created when you assign a value to them:

Example

[Get your own Python Server](#)

```
x = 1      # int
y = 2.8    # float
z = 1j     # complex
```

To verify the type of any object in Python, use the `type()` function:

Example

```
print(type(x))
```

```
print(type(y))  
print(type(z))
```

Int

Int, or integer, is a whole number, positive or negative, without decimals, of unlimited length.

Example

Integers:

```
x = 1  
y = 35656222554887711  
z = -3255522  
  
print(type(x))  
print(type(y))  
print(type(z))
```

[Try it Yourself »](#)

Float

Float, or "floating point number" is a number, positive or negative, containing one or more decimals.

Example

Floats:

```
x = 1.10  
y = 1.0
```

COLOR
PICKER

```
z = -35.59

print(type(x))
print(type(y))
print(type(z))
```

Float can also be scientific numbers with an "e" to indicate the power of 10.

Example

Floats:

```
x = 35e3
y = 12E4
z = -87.7e100

print(type(x))
print(type(y))
print(type(z))
```

ADVERTISEMENT

[REMOVE ADS](#)

```
b = int(y)

#convert from int to complex:
c = complex(x)

print(a)
print(b)
print(c)

print(type(a))
print(type(b))
print(type(c))
```

Try it Yourself »

Note: You cannot convert complex numbers into another number type.

Random Number

Python does not have a `random()` function to make a random number, but Python has a built-in module called `random` that can be used to make random numbers:

Example

Import the random module, and display a random number from 1 to 9:

```
import random

print(random.randrange(1, 10))
```
