Python Random Module

[< Previous](#)[Next >](#)

Python has a built-in module that you can use to make random numbers.

The **random** module has a set of methods:

Method	Description
<u>seed()</u>	Initialize the random number generator
<u>getstate()</u>	Returns the current internal state of the random number generator
<u>setstate()</u>	Restores the internal state of the random number generator
<u>getrandbits()</u>	Returns a number representing the random bits
<u>randrange()</u>	Returns a random number between the given range
<u>randint()</u>	Returns a random number between the given range
<u>choice()</u>	Returns a random element from the given sequence
<u>choices()</u>	Returns a list with a random selection from the given sequence
<u>shuffle()</u>	Takes a sequence and returns the sequence in a random order
<u>sample()</u>	Returns a given sample of a sequence
<u>random()</u>	Returns a random float number between 0 and 1

R

<u>uniform()</u>	Returns a random float number between two given parameters
<u>triangular()</u>	Returns a random float number between two given parameters, you can also set a mode parameter to specify the midpoint between the two other parameters
<u>betavariate()</u>	Returns a random float number between 0 and 1 based on the Beta distribution (used in statistics)
<u>expovariate()</u>	Returns a random float number based on the Exponential distribution (used in statistics)
<u>gammavariate()</u>	Returns a random float number based on the Gamma distribution (used in statistics)
<u>gauss()</u>	Returns a random float number based on the Gaussian distribution (used in probability theories)
<u>lognormvariate()</u>	Returns a random float number based on a log-normal distribution (used in probability theories)
<u>normalvariate()</u>	Returns a random float number based on the normal distribution (used in probability theories)
<u>vonmisesvariate()</u>	Returns a random float number based on the von Mises distribution (used in directional statistics)
<u>paretovariate()</u>	Returns a random float number based on the Pareto distribution (used in probability theories)
<u>weibullvariate()</u>	Returns a random float number based on the Weibull distribution (used in statistics)
