

tf.compat.v1.argmax Stay organized with collections Save and categorize content based on your preferences.

https://www.tensorflow.org/api_docs/python/tf/compat/v1/argmax

*Returns the index with the largest value across axes of a tensor.
(deprecated arguments)*

Function Signatures

```
tf.compat.v1.argmax( input, axis=None, name=None,  
dimension=None, output_type=tf.dtypes.int64 )  
(dimension)
```

Code Examples

```
tf.compat.v1.argmax(  
    input,  
    axis=None,  
    name=None,  
    dimension=None,  
    output_type=tf.dtypes.int64  
)
```

```
tf.compat.v1.argmax(  
    input,  
    axis=None,  
    name=None,  
    dimension=None,  
    output_type=tf.dtypes.int64  
)
```

```
tf.dtypes.int64
```

```
import tensorflow as tf  
a = [1, 10, 26.9, 2.8, 166.32, 62.3]  
b = tf.math.argmax(input = a)  
c = tf.keras.backend.eval(b)  
# c = 4  
# here a[4] = 166.32 which is the largest element of a across axis  
0
```

```
import tensorflow as tf  
a = [1, 10, 26.9, 2.8, 166.32, 62.3]  
b = tf.math.argmax(input = a)  
c = tf.keras.backend.eval(b)  
# c = 4  
# here a[4] = 166.32 which is the largest element of a across axis  
0
```

Documentation

Returns the index with the largest value across axes of a tensor. (deprecated arguments)

Migration guide for more details.

`tf.compat.v1.math.argmax`

Used in the notebooks

- Fitting Dirichlet Process Mixture Model Using Preconditioned Stochastic Gradient Langevin Dynamics
 - Classify Flowers with Transfer Learning
 - Exploring the TF-Hub CORD-19 Swivel Embeddings

Note that in case of ties the identity of the return value is not guaranteed.

Returns
