Public API for `tf._api.v2.data.experimental` namespace

Documentation

Public API for `tf._api.v2.data.experimental` namespace

Modules

service module: Public API for `tf._api.v2.data.experimental.service` namespace

Classes

class `AutoShardPolicy`: Represents the type of auto-sharding to use.

class `AutotuneAlgorithm`: Represents the type of autotuning algorithm to use.

class `AutotuneOptions`: Represents options for autotuning dataset performance.

class `CsvDataset`: A Dataset comprising lines from one or more CSV files.

class `DatasetInitializer`: Creates a table initializer from a `tf.data.Dataset`.

class `DatasetStructure`: Type specification for `tf.data.Dataset`.

class `DistributeOptions`: Represents options for distributed data processing.

class ExternalStatePolicy: Represents how to handle external state during serialization.

class OptimizationOptions: Represents options for dataset optimizations.

class Optional: Represents a value that may or may not be present.

class OptionalStructure: Type specification for tf.experimental.Optional.

class RandomDataset: A Dataset of pseudorandom values.

class Reducer: A reducer is used for reducing a set of elements.

class SqlDataset: A Dataset consisting of the results from a SQL query.

class Structure: Specifies a TensorFlow value type.

class TFRecordWriter: Writes a dataset to a TFRecord file. (deprecated)

class ThreadingOptions: Represents options for dataset threading.

Functions

Counter(...): Creates a Dataset that counts from start in steps of size step. (deprecated)

RaggedTensorStructure(...): DEPRECATED FUNCTION

SparseTensorStructure(...): DEPRECATED FUNCTION

TensorArrayStructure(...): DEPRECATED FUNCTION

TensorStructure(...): DEPRECATED FUNCTION

assert_cardinality(...): Asserts the cardinality of the input dataset.

bucket_by_sequence_length(...): A transformation that buckets elements in a Dataset by length. (deprecated)

cardinality(...): Returns the cardinality of dataset, if known.

`choose_from_datasets(...)`: Creates a dataset that deterministically chooses elements from datasets. (deprecated)

`copy_to_device(...)`: A transformation that copies dataset elements to the given `target_device`.

`dense_to_ragged_batch(...)`: A transformation that batches ragged elements into `tf.RaggedTensors`. (deprecated)

`dense_to_sparse_batch(...)`: A transformation that batches ragged elements into `tf.sparse.SparseTensors`. (deprecated)

`enable_debug_mode(...)`: Enables debug mode for `tf.data`.

`enumerate_dataset(...)`: A transformation that enumerates the elements of a dataset. (deprecated)

`from_list(...)`: Creates a Dataset comprising the given list of elements.

`from_variant(...)`: Constructs a dataset from the given variant and (nested) structure.

`get_next_as_optional(...)`: Returns a `tf.experimental.Optional` with the next element of the iterator. (deprecated)

`get_single_element(...)`: Returns the single element of the dataset as a nested structure of tensors. (deprecated)

`get_structure(...)`: Returns the type signature for elements of the input dataset / iterator.

`group_by_reducer(...)`: A transformation that groups elements and performs a reduction.

`group_by_window(...)`: A transformation that groups windows of elements by key and reduces them. (deprecated)

`ignore_errors(...)`: Creates a Dataset from another Dataset and silently ignores any errors. (deprecated)

`index_table_from_dataset(...)`: Returns an index lookup table based on the given dataset.

`make_batched_features_dataset(...)`: Returns a Dataset of feature dictionaries from Example protos.

`make_csv_dataset(...)`: Reads CSV files into a dataset.

`make_saveable_from_iterator(...)`: Returns a SaveableObject for saving/restoring iterator state using Saver. (deprecated)

`map_and_batch(...)`: Fused implementation of map and batch. (deprecated)

`map_and_batch_with_legacy_function(...)`: Fused implementation of map and batch. (deprecated)

`pad_to_cardinality(...)`: Pads a dataset with fake elements to reach the desired cardinality.

`parallel_interleave(...)`: A parallel version of the `Dataset.interleave()` transformation. (deprecated)

`parse_example_dataset(...)`: A transformation that parses Example protos into a dict of tensors. (deprecated)

`prefetch_to_device(...)`: A transformation that prefetches dataset values to the given device.

`rejection_resample(...)`: A transformation that resamples a dataset to achieve a target distribution. (deprecated)

`sample_from_datasets(...)`: Samples elements at random from the datasets in datasets. (deprecated)

`scan(...)`: A transformation that scans a function across an input dataset. (deprecated)

`shuffle_and_repeat(...)`: Shuffles and repeats a Dataset, reshuffling with each

repetition. (deprecated)

snapshot(...): API to persist the output of the input dataset. (deprecated)

table_from_dataset(...): Returns a lookup table based on the given dataset.

take_while(...): A transformation that stops dataset iteration based on a predicate.
(deprecated)

to_variant(...): Returns a variant representing the given dataset.

unbatch(...): Splits elements of a dataset into multiple elements on the batch dimension. (deprecated)

unique(...): Creates a Dataset from another Dataset, discarding duplicates.
(deprecated)
