

Module: `tf.compat.v1.dtypes` Stay organized with collections Save and categorize content based on your preferences.

https://www.tensorflow.org/api_docs/python/tf/compat/v1/dtypes

Public API for `tf._api.v2.dtypes` namespace

Function Signatures

`as_dtype(...)`

Code Examples

```
{  
tf.qint16,  
tf.qint16_ref,  
tf.qint32,  
tf.qint32_ref,  
tf.qint8,  
tf.qint8_ref,  
tf.quint16,  
tf.quint16_ref,  
tf.quint8,  
tf.quint8_ref  
}
```

```
{  
tf.qint16,  
tf.qint16_ref,  
tf.qint32,  
tf.qint32_ref,  
tf.qint8,  
tf.qint8_ref,  
tf.quint16,  
tf.quint16_ref,  
tf.quint8,  
tf.quint8_ref  
}
```

Documentation

Public API for tf._api.v2.dtypes namespace

Modules

experimental module: Public API for tf._api.v2.dtypes.experimental namespace

Classes

`class DType`: Represents the type of the elements in a Tensor.

Functions

`as_dtype(...)`: Converts the given `type_value` to a `tf.DType`.

`as_string(...)`: Converts each entry in the given tensor to strings.

`cast(...)`: Casts a tensor to a new type.

`complex(...)`: Converts two real numbers to a complex number.

`saturate_cast(...)`: Performs a safe saturating cast of value to dtype.

Other Members

16-bit bfloat (brain floating point).

Boolean.

128-bit complex.

64-bit complex.

64-bit (double precision) floating-point.

16-bit (half precision) floating-point.

32-bit (single precision) floating-point.

64-bit (double precision) floating-point.

16-bit (half precision) floating-point.

Signed 16-bit integer.

Signed 32-bit integer.

Signed 64-bit integer.

Signed 8-bit integer.

Signed quantized 16-bit integer.

signed quantized 32-bit integer.

Signed quantized 8-bit integer.

Unsigned quantized 16-bit integer.

Unsigned quantized 8-bit integer.

Handle to a mutable, dynamically allocated resource.

Variable-length string, represented as byte array.

Unsigned 16-bit (word) integer.

Unsigned 32-bit (dword) integer.

Unsigned 64-bit (qword) integer.

Unsigned 8-bit (byte) integer.

Data of arbitrary type (known at runtime).
