Public API for `tf._api.v2.errors` namespace

Documentation

Public API for `tf._api.v2.errors` namespace

Classes

class `AbortedError`: Raised when an operation was aborted, typically due to a concurrent action.

class `AlreadyExistsError`: Raised when an entity that we attempted to create already exists.

class `CancelledError`: Raised when an operation is cancelled.

class `DataLossError`: Raised when unrecoverable data loss or corruption is encountered.

class `DeadlineExceededError`: Raised when a deadline expires before an operation could complete.

class `FailedPreconditionError`: Raised when some prerequisites are not met when running an operation.

class `InternalError`: Raised when the system experiences an internal error.

class `InvalidArgumentError`: Raised when an operation receives an invalid argument.

class `NotFoundError`: Raised when a requested entity (e.g., a file or directory) was not found.

class `OpError`: The base class for TensorFlow exceptions.

class `OutOfRangeError`: Raised when an operation iterates past the valid range.

class `PermissionDeniedError`: Raised when the caller does not have permission to run an operation.

class `ResourceExhaustedError`: Raised when some resource has been exhausted while running operation.

class `UnauthenticatedError`: Raised when the request does not have valid authentication credentials.

class `UnavailableError`: Raised when the runtime is currently unavailable.

class `UnimplementedError`: Raised when an operation has not been implemented.

class `UnknownError`: Unknown error.

class `raise_exception_on_not_ok_status`: Context manager to check for C API status.
