

tf.compat.v1.get_variable_scope Stay organized with collections Save and categorize content based on your preferences.

https://www.tensorflow.org/api_docs/python/tf/compat/v1/get_variable_scope

Returns the current variable scope.

Function Signatures

```
tf.compat.v1.get_variable_scope()
```

Code Examples

```
tf.compat.v1.get_variable_scope()
```

```
tf.compat.v1.get_variable_scope()
```

```
x = tf.name_scope('foo') as current_scope:  
...
```

```
x = tf.name_scope('foo') as current_scope:  
...
```

Documentation

Returns the current variable scope.

Migrate to TF2

Although it is a legacy `compat.v1` api,
`tf.compat.v1.get_variable` is compatible with eager
execution and `tf.function`

However, to maintain variable-scope based variable reuse
you will need to combine it with
`tf.compat.v1.keras.utils.track_tf1_style_variables`. (Though
it will behave as if reuse is always set to `tf.compat.v1.AUTO_REUSE`.)

See the
migration guide
for more info.

The TF2 equivalent, if you are just trying to track
variable name prefixes and not control `get_variable`-based variable reuse,
would be to use `tf.name_scope` and capture the output of opening the
scope (which represents the current name prefix).

For example:

```
## Description
```
