https://www.tensorflow.org/api_docs/python/tf/compat/v1/quantization

Public API for `tf._api.v2.quantization` namespace

Function Signatures

```
dequantize(...)
fake_quant_with_min_max_args(...)
fake_quant_with_min_max_args_gradient(...)
fake_quant_with_min_max_vars(...)
```

Documentation

Public API for `tf._api.v2.quantization` namespace

Modules

`experimental` module: Public API for `tf._api.v2.quantization.experimental` namespace

Functions

`dequantize(...)`: Dequantize the 'input' tensor into a float or bfloat16 Tensor.

`fake_quant_with_min_max_args(...)`: Fake-quantize the 'inputs' tensor, type float to 'outputs' tensor of same shape and type.

`fake_quant_with_min_max_args_gradient(...)`: Compute gradients for a FakeQuantWithMinMaxArgs operation.

`fake_quant_with_min_max_vars(...)`: Fake-quantize the 'inputs' tensor of type float via global float scalars

`fake_quant_with_min_max_vars_gradient(...)`: Compute gradients for a FakeQuantWithMinMaxVars operation.

`fake_quant_with_min_max_vars_per_channel(...)`: Fake-quantize the 'inputs' tensor of type float via per-channel floats

`fake_quant_with_min_max_vars_per_channel_gradient(...)`: Compute gradients for a FakeQuantWithMinMaxVarsPerChannel operation.

`quantize(...)`: Quantize the 'input' tensor of type float to 'output' tensor of type 'T'.

`quantize_and_dequantize(...)`: Quantizes then dequantizes a tensor. (deprecated)

`quantize_and_dequantize_v2(...)`: Quantizes then dequantizes a tensor.

`quantized_concat(...)`: Concatenates quantized tensors along one dimension.
