https://www.tensorflow.org/api_docs/python/tf/register_tensor_conversion_function

Registers a function for converting objects of base_type to Tensor.

Function Signatures

```
tf.register_tensor_conversion_function( base_type,  
conversion_func, priority=100 )  
def conversion_func(value, dtype=None, name=None,  
as_ref=False): # ...
```

Code Examples

```
tf.register_tensor_conversion_function(  
    base_type, conversion_func, priority=100  
)
```

```
tf.register_tensor_conversion_function(  
    base_type, conversion_func, priority=100  
)
```

```
def conversion_func(value, dtype=None, name=None, as_ref=False):  
    # ...
```

```
def conversion_func(value, dtype=None, name=None, as_ref=False):  
    # ...
```

Documentation

Registers a function for converting objects of `base_type` to Tensor.

`tf.compat.v1.register_tensor_conversion_function`

The conversion function must have the following signature:

It must return a Tensor with the given dtype if specified. If the conversion function creates a new Tensor, it should use the given name if specified. All exceptions will be propagated to the caller.

The conversion function may return `NotImplemented` for some inputs. In this case, the conversion process will continue to try subsequent conversion functions.

If `as_ref` is true, the function must return a Tensor reference, such as a `Variable`.

Raises
