

torch.cuda.memory.caching_allocator_alloc

https://pytorch.org/docs/stable/generated/torch.cuda.memory.caching_allocator_alloc

Description:

Perform a memory allocation using the CUDA memory allocator. Memory is allocated for a given device and a stream, this function is intended to be used for interoperability with other frameworks. Allocated memory is released through `caching_allocator_delete()`. `size` (int) – number of bytes to be allocated. `device` (torch.device or int, optional) – selected device. If it is None the default CUDA device is used. `stream` (torch.cuda.Stream or int, optional) – selected stream. If is None then the default stream for the selected device is used.

Function Signature

```
torch.cuda.memory.caching_allocator_alloc(size, device=None, stream=None)[source]#
```

Parameters

Notes & Warnings

NOTE

Note See Memory management for more details about GPU memory management.

Detailed Documentation

Documentation

Perform a memory allocation using the CUDA memory allocator.

Memory is allocated for a given device and a stream, this function is intended to be used for interoperability with other frameworks. Allocated memory is released through `caching_allocator_delete()`.

`size` (int) – number of bytes to be allocated.

`device` (torch.device or int, optional) – selected device. If it is None the default CUDA device is used.

`stream` (torch.cuda.Stream or int, optional) – selected stream. If is None then the default stream for the selected device is used.

See Memory management for more details about GPU memory management.
