

torch.cuda.memory.set_per_process_memory_fraction

https://pytorch.org/docs/stable/generated/torch.cuda.memory.set_per_process_memory_fraction.html

Description:

Set memory fraction for a process. The fraction is used to limit an caching allocator to allocated memory on a CUDA device. The allowed value equals the total visible memory multiplied fraction. If trying to allocate more than the allowed value in a process, will raise an out of memory error in allocator. fraction (float) – Range: 0~1. Allowed memory equals $\text{total_memory} * \text{fraction}$. device (torch.device or int, optional) – selected device. If it is None the default CUDA device is used.

Function Signature

```
torch.cuda.memory.set_per_process_memory_fraction(fraction,  
device=None)[source]#
```

Parameters

Notes & Warnings

NOTE

Note In general, the total available free memory is less than the total capacity.

Detailed Documentation

Documentation

Set memory fraction for a process.

The fraction is used to limit an caching allocator to allocated memory on a CUDA device. The allowed value equals the total visible memory multiplied fraction. If trying to allocate more than the allowed value in a process, will raise an out of memory error in allocator.

fraction (float) – Range: 0~1. Allowed memory equals $\text{total_memory} * \text{fraction}$.

device (torch.device or int, optional) – selected device. If it is None the default CUDA device is used.

In general, the total available free memory is less than the total capacity.
