

torch.nn.functional.softmin#

<https://pytorch.org/docs/stable/generated/torch.nn.functional.softmin.html>

Description:

Apply a softmin function. Note that $\text{Softmin}(x) = \text{Softmax}(-x)$. See softmax definition for mathematical formula. See Softmin for more details. input (Tensor) – input dim (int) – A dimension along which softmin will be computed (so every slice along dim will sum to 1).

Function Signature

```
torch.nn.functional.softmin(input, dim=None, _stacklevel=3, dtype=None)[source]#
```

Parameters

Return type

Returns:

Tensor

Detailed Documentation

Documentation

Apply a softmin function.

Note that $\text{Softmin}(x) = \text{Softmax}(-x)$ $\text{Softmin}(x) = \text{Softmax}(-x)$. See softmax definition for mathematical formula.

See Softmin for more details.

input (Tensor) – input

dim (int) – A dimension along which softmin will be computed (so every slice along dim will sum to 1).

dtype (torch.dtype, optional) – the desired data type of returned tensor. If specified, the input tensor is casted to dtype before the operation is performed. This is useful for preventing data type overflows. Default: None.
