

torch.nn.functional.softplus#

<https://pytorch.org/docs/stable/generated/torch.nn.functional.softplus.html>

Description:

Applies element-wise, the function $\text{Softplus}(x) = \frac{1}{\beta} \log(1 + \exp(\beta x))$. For numerical stability the implementation reverts to the linear function when $\text{input} \times \beta > \text{threshold}$. See `Softplus` for more details.

Function Signature

```
torch.nn.functional.softplus(input, beta=1, threshold=20) → Tensor#
```

Detailed Documentation

Documentation

Applies element-wise, the function $\text{Softplus}(x) = \frac{1}{\beta} \log(1 + \exp(\beta x))$
 $\text{Softplus}(x) = \frac{1}{\beta} \log(1 + \exp(\beta x))$

For numerical stability the implementation reverts to the linear function when $\text{input} \times \beta > \text{threshold}$

See `Softplus` for more details.
