

torch.nn.functional.parallel.data_parallel

https://pytorch.org/docs/stable/generated/torch.nn.functional.parallel.data_parallel

Description:

Evaluate module(input) in parallel across the GPUs given in device_ids.

This is the functional version of the DataParallel module. module (Module)

– the module to evaluate in parallel inputs (Tensor) – inputs to the module

device_ids (list of int or torch.device) – GPU ids on which to replicate module

Function Signature

```
torch.nn.parallel.data_parallel(module, inputs,  
device_ids=None, output_device=None, dim=0,  
module_kwargs=None)[source]#
```

Parameters

Returns

Return type

Returns:

Tensor

Detailed Documentation

Documentation

Evaluate `module(input)` in parallel across the GPUs given in `device_ids`.

This is the functional version of the `DataParallel` module.

`module (Module)` – the module to evaluate in parallel

`inputs (Tensor)` – inputs to the module

`device_ids (list of int or torch.device)` – GPU ids on which to replicate module

`output_device (list of int or torch.device)` – GPU location of the output Use -1 to indicate the CPU. (default: `device_ids[0]`)

a Tensor containing the result of `module(input)` located on `output_device`
