

Softmin#

<https://pytorch.org/docs/stable/generated/torch.nn.modules.activation.Softmin>

Description:

Applies the Softmin function to an n-dimensional input Tensor. Rescales them so that the elements of the n-dimensional output Tensor lie in the range [0, 1] and sum to 1. Softmin is defined as: Input: $(*)^{(*)} (*)$ where $*$ means, any number of additional dimensions Output: $(*)^{(*)} (*)$, same shape as the input

Function Signature

```
class torch.nn.modules.activation.Softmin(dim=None)[source]#
```

Shape:

Parameters

Returns

Return type

Returns:

Tensor

Code Examples

```
>>> m = nn.Softmin(dim=1)
>>> input = torch.randn(2, 3)
>>> output = m(input)
```

Detailed Documentation

Documentation

Applies the Softmin function to an n-dimensional input Tensor.

Rescales them so that the elements of the n-dimensional output Tensor lie in the range [0, 1] and sum to 1.

Softmin is defined as:

Input: $(*)^{(*)} (*)$ where $*$ means, any number of additional dimensions

Output: $(*)^{(*)} (*)$, same shape as the input

dim (int) – A dimension along which Softmin will be computed (so every slice along dim will sum to 1).

a Tensor of the same dimension and shape as the input, with values in the range [0, 1]

Return the extra representation of the module.

Runs the forward pass.
