

torch.nn.modules.module.register_module

https://pytorch.org/docs/stable/generated/torch.nn.modules.module.register_m

Description:

Register a forward pre-hook common to all modules. This adds global state to the `nn.module` module and it is only intended for debugging/profiling purposes. The hook will be called every time before `forward()` is invoked. It should have the following signature: The input contains only the positional arguments given to the module. Keyword arguments won't be passed to the hooks and only to the forward. The hook can modify the input. User can either return a tuple or a single modified value in the hook. We will wrap the value into a tuple if a single value is returned(unless that value is already a tuple).

Function Signature

```
torch.nn.modules.module.register_module_forward_pre_hook(hook) [source]#
```

Returns

Return type

Returns:

`torch.utils.hooks.RemovableHandle`

Code Examples

```
hook(module, input) -> None or modified input
```

Notes & Warnings

WARNING

Warning This adds global state to the `nn.module` module and it is only intended for debugging/profiling purposes.

Detailed Documentation

Documentation

Register a forward pre-hook common to all modules.

This adds global state to the `nn.module` module and it is only intended for debugging/profiling purposes.

The hook will be called every time before `forward()` is invoked. It should have the following signature:

The input contains only the positional arguments given to the module. Keyword arguments won't be passed to the hooks and only to the forward. The hook can modify the input. User can either return a tuple or a single modified value in the hook. We will wrap the value into a tuple if a single value is returned(unless that value is already a tuple).

This hook has precedence over the specific module hooks registered with `register_forward_pre_hook`.

a handle that can be used to remove the added hook by calling `handle.remove()`

`torch.utils.hooks.RemovableHandle`
