

torch.nn.utils.parametrize.remove_parametrization

https://pytorch.org/docs/stable/generated/torch.nn.utils.parametrize.remove_parametrization.html

Description:

Remove the parametrizations on a tensor in a module. If `leave_parametrized=True`, `module[tensor_name]` will be set to its current output. In this case, the parametrization shall not change the dtype of the tensor. If `leave_parametrized=False`, `module[tensor_name]` will be set to the unparametrised tensor in `module.parametrize[tensor_name].original`. This is only possible when the parametrization depends on just one tensor.

`module` (nn.Module) – module from which remove the parametrization
`tensor_name` (str) – name of the parametrization to be removed

Function Signature

```
torch.nn.utils.parametrize.remove_parametrizations(module,  
tensor_name, leave_parametrized=True)[source]#
```

Detailed Documentation

Documentation

Remove the parametrizations on a tensor in a module.

If `leave_parametrized=True`, `module[tensor_name]` will be set to its current output. In this case, the parametrization shall not change the dtype of the tensor.

If `leave_parametrized=False`, `module[tensor_name]` will be set to the unparametrised tensor in `module.parametrizations[tensor_name].original`. This is only possible when the parametrization depends on just one tensor.

`module` (`nn.Module`) – module from which remove the parametrization

`tensor_name` (`str`) – name of the parametrization to be removed

`leave_parametrized` (`bool`, optional) – leave the attribute `tensor_name` parametrized.
Default: `True`

`ValueError` – if `module[tensor_name]` is not parametrized

`ValueError` – if `leave_parametrized=False` and the parametrization depends on several tensors
