

torch.nn.utils.prune.remove#

<https://pytorch.org/docs/stable/generated/torch.nn.utils.prune.remove.html#t>

Description:

Remove the pruning reparameterization from a module and the pruning method from the forward hook. The pruned parameter named `name` remains permanently pruned, and the parameter named `name+'_orig'` is removed from the parameter list. Similarly, the buffer named `name+'_mask'` is removed from the buffers. Pruning itself is NOT undone or reversed! `module (nn.Module)` – module containing the tensor to prune

Function Signature

```
torch.nn.utils.prune.remove(module, name)[source]#
```

Parameters

Code Examples

```
>>> m = random_unstructured(nn.Linear(5, 7), name="weight",  
amount=0.2)  
>>> m = remove(m, name="weight")
```

Notes & Warnings

NOTE

Note Pruning itself is NOT undone or reversed!

Detailed Documentation

Documentation

Remove the pruning reparameterization from a module and the pruning method from the forward hook.

The pruned parameter named `name` remains permanently pruned, and the parameter named `name+'_orig'` is removed from the parameter list. Similarly, the buffer named `name+'_mask'` is removed from the buffers.

Pruning itself is NOT undone or reversed!

`module (nn.Module)` – module containing the tensor to prune

name (str) – parameter name within module on which pruning will act.

Remove the pruning reparameterization from a module and the pruning method from the forward hook.

The pruned parameter named name remains permanently pruned, and the parameter named name+'_orig' is removed from the parameter list. Similarly, the buffer named name+'_mask' is removed from the buffers.

Pruning itself is NOT undone or reversed!

module (nn.Module) – module containing the tensor to prune

module (nn.Module) – module containing the tensor to prune

name (str) – parameter name within module on which pruning will act.

name (str) – parameter name within module on which pruning will act.
