

torch.accelerator.memory.max_memory_allocated

https://pytorch.org/docs/stable/generated/torch.accelerator.memory.max_memory_allocated

Description:

Return the current accelerator maximum device memory occupied by tensors in bytes for a given device index. By default, this returns the peak allocated memory since the beginning of this program. `reset_peak_memory_stats()` can be used to reset the starting point in tracking this metric. `device_index` (`torch.device`, `str`, `int`, optional) – the index of the device to target. If not given, use `torch.accelerator.current_device_index()` by default. If a `torch.device` or `str` is provided, its type must match the current accelerator device type.

Function Signature

```
torch.accelerator.memory.max_memory_allocated(device_index=None, /)[source]#
```

Parameters

Return type

Returns:

int

Detailed Documentation

Documentation

Return the current accelerator maximum device memory occupied by tensors in bytes for a given device index.

By default, this returns the peak allocated memory since the beginning of this program. `reset_peak_memory_stats()` can be used to reset the starting point in tracking this metric.

`device_index` (`torch.device`, `str`, `int`, optional) – the index of the device to target. If not given, use `torch.accelerator.current_device_index()` by default. If a `torch.device` or `str` is provided, its type must match the current accelerator device type.
