

QuantWrapper#

<https://pytorch.org/docs/stable/generated/torch.ao.quantization.QuantWrapper>

Description:

A wrapper class that wraps the input module, adds QuantStub and DeQuantStub and surround the call to module with call to quant and dequant modules. This is used by the quantization utility functions to add the quant and dequant modules, before convert function QuantStub will just be observer, it observes the input tensor, after convert, QuantStub will be swapped to nnq.Quantize which does actual quantization. Similarly for DeQuantStub.

Function Signature

```
class torch.ao.quantization.QuantWrapper(module)[source]#
```

Detailed Documentation

Documentation

A wrapper class that wraps the input module, adds QuantStub and DeQuantStub and surround the call to module with call to quant and dequant modules.

This is used by the quantization utility functions to add the quant and dequant modules, before convert function QuantStub will just be observer, it observes the input tensor, after convert, QuantStub will be swapped to nnq.Quantize which does actual quantization. Similarly for DeQuantStub.

A wrapper class that wraps the input module, adds QuantStub and DeQuantStub and surround the call to module with call to quant and dequant modules.

This is used by the quantization utility functions to add the quant and dequant modules, before convert function QuantStub will just be observer, it observes the input tensor, after convert, QuantStub will be swapped to nnq.Quantize which does actual quantization. Similarly for DeQuantStub.
