

add_quant_dequant#

https://pytorch.org/docs/stable/generated/torch.ao.quantization.add_quant_de

Description:

Wrap the leaf child module in QuantWrapper if it has a valid qconfig Note that this function will modify the children of module inplace and it can return a new module which wraps the input module as well. module – input module with qconfig attributes for all the leaf modules quantize (that we want to) – Either the inplace modified module with submodules wrapped in QuantWrapper based on qconfig or a new QuantWrapper module which wraps the input module, the latter case only happens when the input module is a leaf module and we want to quantize it.

Function Signature

```
class torch.ao.quantization.add_quant_dequant(module)
[source]#
```

Parameters

Returns

Returns:

Either the inplace modified module with submodules wrapped in QuantWrapper based on qconfig or a new QuantWrapper module which wraps the input module, the latter case only happens when the input module is a leaf module and we want to quantize it.

Detailed Documentation

Documentation

Wrap the leaf child module in QuantWrapper if it has a valid qconfig Note that this function will modify the children of module inplace and it can return a new module which wraps the input module as well.

module – input module with qconfig attributes for all the leaf modules

quantize (that we want to) –

Either the inplace modified module with submodules wrapped in QuantWrapper based on qconfig or a new QuantWrapper module which wraps the input module, the latter case only happens when the input module is a leaf module and we want to quantize it.
