

extract_results_from_loggers#

https://pytorch.org/docs/stable/generated/torch.ao.quantization.extract_results_from_loggers.html

Description:

For a given model, extract the tensors stats and related information for each debug handle. The reason we have a list of object, instead of Tensor is because the output of node may not be a Tensor, it could be (nested) list, tuple or dict as well. A dict is keyed by the debug_handle id and the values are a list of object recorded in loggers dict[int, tuple[Optional[str], object, list[object]]]

Function Signature

```
class
torch.ao.quantization.extract_results_from_loggers(model)
[source]#
```

Returns

Return type

Returns:

`dict[int, tuple[Optional[str], object, list[object]]]`

Detailed Documentation

Documentation

For a given model, extract the tensors stats and related information for each debug handle. The reason we have a list of object, instead of Tensor is because the output of node may not be a Tensor, it could be (nested) list, tuple or dict as well.

A dict is keyed by the debug_handle id and the values are a list of object recorded in loggers

`dict[int, tuple[Optional[str], object, list[object]]]`

For a given model, extract the tensors stats and related information for each debug handle. The reason we have a list of object, instead of Tensor is because the output of node may not be a Tensor, it could be (nested) list, tuple or dict as well.

A dict is keyed by the debug_handle id and the values are a list of object recorded in loggers

`dict[int, tuple[Optional[str], object, list[object]]]`
