

NoopObserver#

<https://pytorch.org/docs/stable/generated/torch.ao.quantization.observer.NoopObserver.html>

Description:

Observer that doesn't do anything and just passes its configuration to the quantized module's `.from_float()`. Primarily used for quantization to float16 which doesn't require determining ranges. `dtype` – Quantized data type `custom_op_name` – (temporary) specify this observer for an operator that doesn't require any observation (Can be used in Graph Mode Passes for special case ops).

Function Signature

```
class  
torch.ao.quantization.observer.NoopObserver(dtype=torch.float16, custom_op_name='') [source]#
```

Parameters

Detailed Documentation

Documentation

Observer that doesn't do anything and just passes its configuration to the quantized module's `.from_float()`.

Primarily used for quantization to float16 which doesn't require determining ranges.

`dtype` – Quantized data type

`custom_op_name` – (temporary) specify this observer for an operator that doesn't require any observation (Can be used in Graph Mode Passes for special case ops).

Observer that doesn't do anything and just passes its configuration to the quantized module's `.from_float()`.

Primarily used for quantization to float16 which doesn't require determining ranges.
